

What is our web content filtering managed service?

This service deploys web content filtering software to protect your network from trojans and malware whilst simultaneously shielding employees from inappropriate online content. It continually scans and monitors incoming threats via the internet and blocks them in real time.

Web content filtering works on a permissions basis, and K3 can configure to users, groups, timeframes, URLs, risk scores and more to suit your business' internet use.

Web content filtering also ensures that bandwidth is prioritised for business use and where necessary, restricts personal browsing to help drive productivity and engagement.

What are the features and benefits?

- Identifies and blocks threats in real time to protect your systems from infection and your employees from harmful content
- Supports productivity by filtering out distractions, enabling employees to deliver better customer service and results
- Helps with business bandwidth efficiency and cost management by reducing wastage on personal use
- Provides insights for formulating policy without a need for outright bans, improving positive colleague engagement
- Detailed reporting for developing threat analysis
- Continual management and monitoring for optimal performance and reliability
- 24/7 helpdesk support to efficiently resolve queries
